

CLARINEN

Bleaching and cleaning solution containing oxidising agent.

PROPERTIES

Appearance	:Light green fluid
Active Substance	:25.0 % ± 1.0 NaClO ₂
Ph	: >10.0 Sol. 10.0 %
Shelf Life	:36 months in original well closed container

CHARACTERISTICS

- * Fully miscible in water
- * Particularly suitable for grain cleaning

APPLICATIONS

CLARINEN is an oxidising agent suitable for the cleaning and bleaching of every kind of leather, during the beamhouse operations.

CLARINEN is normally used in the pickle bath before the acid addition. Suggested quantities are between 0.7 % and 1.5 % on the flesh weight.

The acid addition allows the formation of active chlorine that gives an oxidising action and therefore a bleaching action.

This treatment allows elimination or reduction to a minimum blood stain problems. After the treatment with CLARINEN also the hair roots will be more clean and the wrinkles will be less accentuated.

As per all the products that develop active chlorine, it is suggested to work in drums with an aspiration system and under the control of a leather technician.
